### **DETAILED ACTION**

The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

#### ***Claim Rejections - 35 USC § 102/103***

Claim 1-3, 5-7, 9-20 are rejected under 35 U.S.C. 102(b) as anticipated by or, in the alternative, under 35 U.S.C. 103(a) as obvious over Genders et al. (Genders), U.S. Patent 6,004,445.

Genders discloses the claimed method for improving the throughput in continuous electrodialysis process to create product, the method comprising automatically neutralizing byproduct acid generated in acid loop solutions residing in an electrodialysis stack by adding a buffer which comprises components of the product or neutralizing, the buffer keeps the solution in the stack within 2 pH units (see claims 1-23). The reference further discloses the use of the formation of an acidic solution and the buffer is added to the solution (see example 3 in col. 11). The reference further discloses the formation of a basic solution, i.e., potassium bicarbonate, and the buffer is added to the solution (see example 2, in col. 11). The reference further discloses that the buffer is premixed with a solution situated remotely from the stack and within the temperature claimed (see figures 1-5).

Accordingly, the claims are anticipated.

In the alternative, the claims would have been obvious to one having ordinary skill in the art at the time the invention was made to modify the disclosure of the

Art Unit: 1795

Genders patent with the teachings contained therein, because the patent teaches that the pH needs to be controlled to produce the desired product.

### ***Response to Arguments***
